

The following is an introduction to noteworthy feature of APEXFiz Design software version V-06.

## Embroidery Simulation > Export for U3M (Evaluation Version)

■ Supported Plans: **Design-Standard** **Design-Knit** **Design-Weave** **Design Pro**

When running embroidery simulation, it is now possible to export various map images and their U3M file (management file for the map images). When using these files to drape materials on objects in other 3D software, images will feature such realism as the natural uneven texture of embroidery as well as the thread used.

## Adding flat template data to New (3D Socks)

■ Supported Plans: **Design-Knit** **Design Pro** **3D (option)**

Flat template data for the front and side views are added. This will enable you to easily check the design on the instep and side of the socks. In addition, you can create sock data to resemble products on display in stores.
